

Javalin

Simple REST APIs for Java and Kotlin

Get your REST API up and running in seconds. Add the [dependency](#) and copy example:

[Java](#)[Kotlin](#)

```
import io.javalin.Javalin;

public class HelloWorld {
    public static void main(String[] args) {
        Javalin app = Javalin.start(7000);
        app.get("/", ctx -> ctx.result("Hello World"));
    }
}
```

[Copy](#)

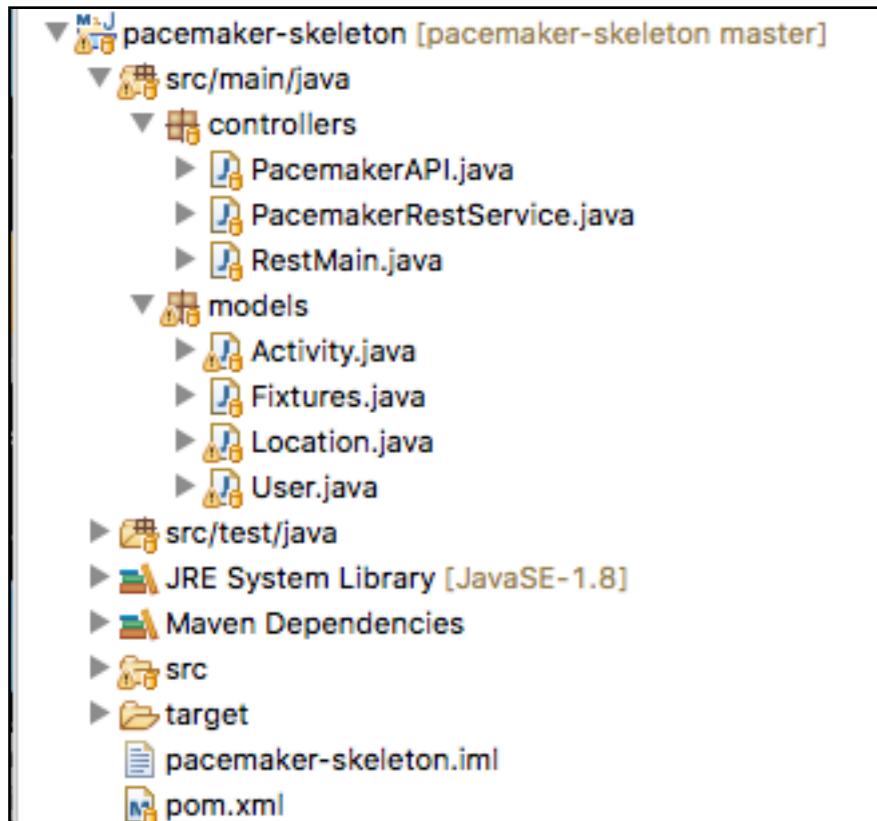

REST API Simplicity

Javalin started as a fork of the [Spark Java](#) and [Kotlin](#) web framework but quickly turned into a ground-up rewrite influenced by [koa.js](#). All of these web frameworks are inspired by the modern micro web framework grandfather: [Sinatra](#), so if you're coming from Ruby then Javalin shouldn't feel *too* unfamiliar.

Javalin is not aiming to be a full web framework, but rather just a lightweight REST API library. There is no concept of MVC, but there is support for template engines, websockets, and static file serving for convenience. This allows you to use Javalin for both creating your RESTful API backend, as well as serving an [index.html](#) with static resources (in case you're creating an SPA). This is practical if you don't want to deploy to apache or nginx in addition to your Javalin service. If you wish to use Javalin to create web-pages instead of just REST APIs, there are some simple template engine wrappers available for a quick and easy setup.

pacemaker-skeleton

Extend project to include Javalin components

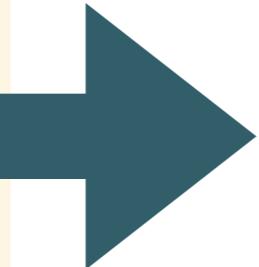

```
<dependency>
    <groupId>io.javalin</groupId>
    <artifactId>javalin</artifactId>
    <version>0.5.1</version>
</dependency>
<dependency>
    <groupId>org.slf4j</groupId>
    <artifactId>slf4j-simple</artifactId>
    <version>1.7.21</version>
</dependency>
<dependency>
    <groupId>com.fasterxml.jackson.core</groupId>
    <artifactId>jackson-databind</artifactId>
    <version>2.9.1</version>
</dependency>
```

pom.xml

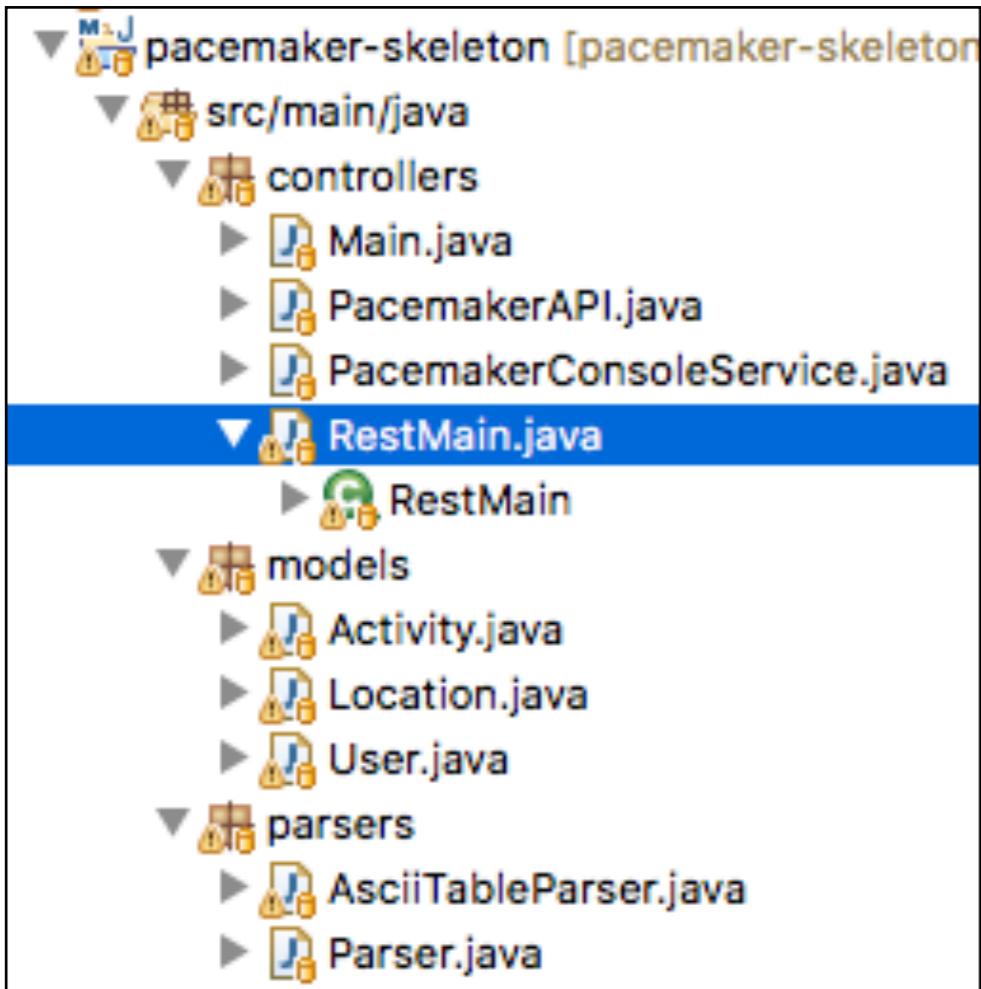

Eclipse downloads and injects range of components to support creation of REST services, including

- web server
- http protocol support
- json/java translation

```
<dependency>
  <groupId>io.javalin</groupId>
  <artifactId>javalin</artifactId>
  <version>0.5.1</version>
</dependency>
<dependency>
  <groupId>org.slf4j</groupId>
  <artifactId>slf4j-simple</artifactId>
  <version>1.7.21</version>
</dependency>
<dependency>
  <groupId>com.fasterxml.jackson.core</groupId>
  <artifactId>jackson-databind</artifactId>
  <version>2.9.1</version>
</dependency>
```

Web Application
(which will serve
an API) running
on local
workstation

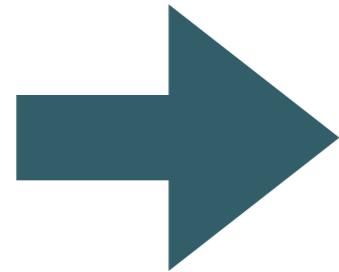

Extend main to define REST API

```
package controllers;  
  
import io.javalin.Javalin;  
  
public class RestMain {  
  
    public static void main(String[] args) throws Exception {  
        Javalin app = Javalin.start(7000);  
        PacemakerRestService service = new PacemakerRestService();  
        configRoutes(app, service);  
    }  
  
    static void configRoutes(Javalin app, PacemakerRestService service) {  
  
        app.get("/users", ctx -> {  
            service.listUsers(ctx);  
        });  
    }  
}
```

First version of API (stubb)

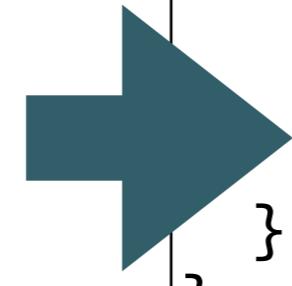

```
package controllers;  
  
import io.javalin.Context;  
  
public class PacemakerRestService {  
  
    PacemakerAPI pacemaker = new PacemakerAPI();  
  
    public void listUsers(Context ctx) {  
        // TODO: return users in json format  
    }  
}
```

A screenshot of a web browser window. The address bar shows 'localhost:7000/users'. The main content area is mostly blank, with a large blue arrow pointing from the browser towards the code editor. Below the browser is the developer tools interface, specifically the Network tab. It shows a single request named 'users' with a status of 200, type 'document', initiator 'Other', size 132 B, and time 8 ms. The Waterfall section shows a single vertical bar representing the request. At the bottom of the developer tools, the status bar says '1 requests | 132 B transferred | Finish: 8 ms | DOMContentLoaded: 16 ms | Load: 16 ms'.

```
package controllers;  
  
import io.javalin.Context;  
  
public class PacemakerRestService {  
  
    PacemakerAPI pacemaker = new PacemakerAPI();  
  
    public void listUsers(Context ctx) {  
        // TODO: return users in json format  
    }  
}
```

listUsers ()
should query
pacemakerAPI
and return
users in json
format

Fetch list of users
from pacemaker.
Convert list to
JSON.
Send JSON list as
response to client

```
package controllers;

import io.javalin.Context;

public class PacemakerRestService {

    PacemakerAPI pacemaker = new PacemakerAPI();

    public void listUsers(Context ctx) {
        ctx.json(pacemaker.getUsers());
    }
}
```

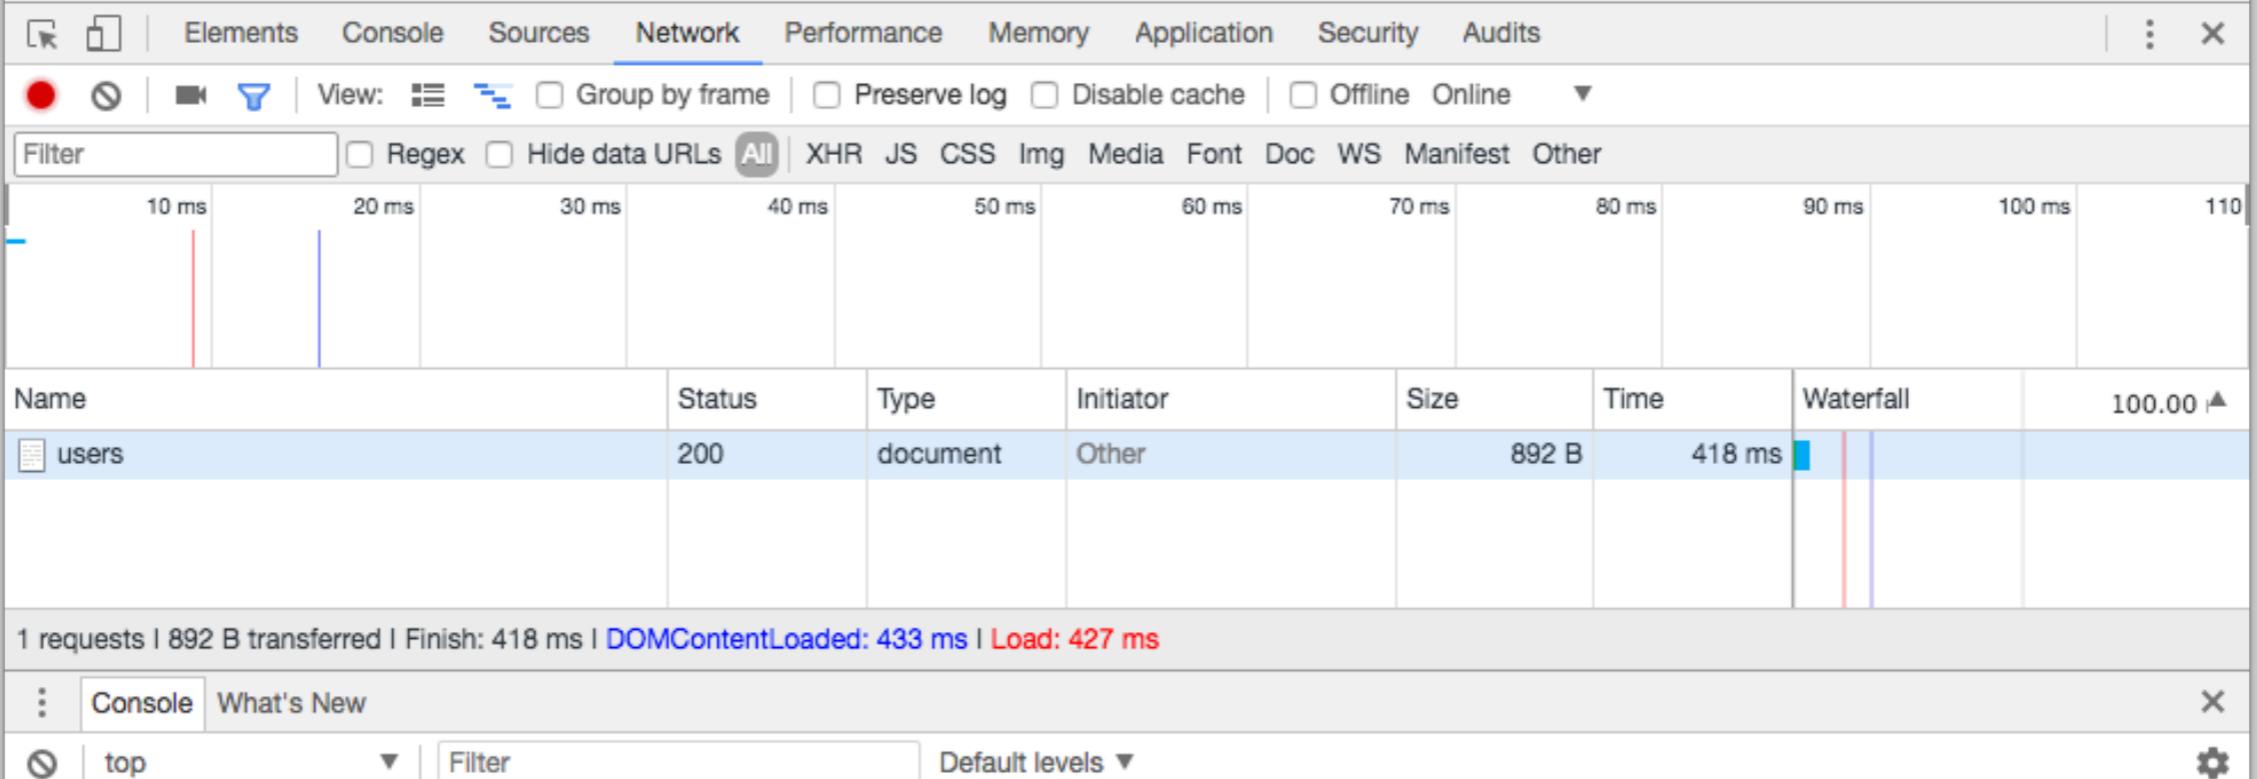

ctx.json(object);

// set result with object-as-json (requires jackson)

localhost:7000/users Eamonn

localhost:7000/users

```
{"id": "a365b857-f5c7-45dc-9255-81ba7d2d6523", "firstName": "marge", "lastName": "simpson", "email": "marge@simpson.com", "password": "secret", "activities": {}}, {"firstname": "marge", "lastname": "simpson"}, {"id": "04416a7f-c8f4-4462-87d6-ab5da2529a25", "firstName": "lisa", "lastName": "simpson", "email": "lisa@simpson.com", "password": "secret", "activities": {}}, {"firstname": "lisa", "lastname": "simpson"}, {"id": "4389d2fb-18c7-43b4-a6ed-3d52d55a315a", "firstName": "bart", "lastName": "simpson", "email": "bart@simpson.com", "password": "secret", "activities": {}}, {"firstname": "bart", "lastname": "simpson"}, {"id": "f0662dae-21fe-40d6-a47a-3fc45847f738", "firstName": "maggie", "lastName": "simpson", "email": "maggie@simpson.com", "password": "secret", "activities": {}}, {"firstname": "maggie", "lastname": "simpson"}]
```

Export Import + Add

pacemaker Endpoints

GET	/users	: read all users
POST	/users	: create a new user
GET	/users/id	: get a specific user (by id)
GET	/users/id/activities	: get activities for specific user (by id)
POST	/users/id/activities	: create activity for specific user (by id)

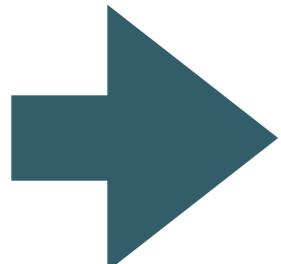

Endpoints deliver API for user
and activity resources

Access to API from any REST
away client

GET	/users	: read all users
POST	/users	: create a new user
GET	/users/:id	: get a specific user (by id)
GET	/users/:id/activities	: get activities for specific user (by id)
POST	/users/:id/activities	: create activity for specific user (by id)

Endpoint Interface

Routes:
here we define
the supported
endpoints

```
static void configRoutes(Javalin app, PacemakerRestService service) {  
  
    app.get("/users", ctx -> {  
        service.listUsers(ctx);  
    });  
  
    app.post("/users", ctx -> {  
        service.createUser(ctx);  
    });  
  
    app.get("/users/:id", ctx -> {  
        service.listUser(ctx);  
    });  
  
    app.get("/users/:id/activities", ctx -> {  
        service.getActivities(ctx);  
    });  
  
    app.post("/users/:id/activities", ctx -> {  
        service.createActivity(ctx);  
    });  
}
```

Create User Endpoint

POST	/users	: create a new user
------	--------	---------------------

Endpoint Interface

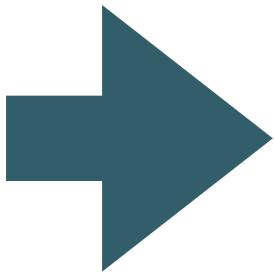

```
app.post("/users", ctx -> {
    service.createUser(ctx);
});
```

Endpoint Implementation

```
public void createUser(Context ctx) {
    User user = ctx.bodyAsClass(User.class);
    User newUser = pacemaker
        .createUser(user.firstname, user.lastname, user.email, user.password);
    ctx.json(newUser);
}
```

Testing the Endpoint

Formulate POST request

REQUEST

METHOD: POST | SCHEME :// HOST [":" PORT] [PATH ["?" QUERY]] | http://localhost:7000/users | length: 27 bytes | Send

QUERY PARAMETERS

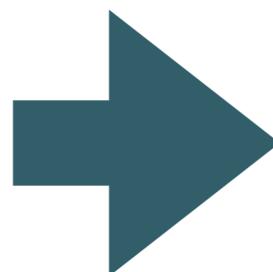

HEADERS: Content-Type: application/json | Form | + Add header | Add authorization

}
```

Convert incoming JSON object to Java Object

```
public void createUser(Context ctx) {  
    User user = ctx.bodyAsClass(User.class);  
  
    User newUser = pacemaker  
        .createUser(user.firstname, user.lastname, user.email, user.password);  
  
    ctx.json(newUser);  
}
```

Create object using pacemaker

Convert new user object (including id) to json and return to client

```
▼ {  
  id: "105f8db6-ec5c-4740-b504-0cb64e6c468a",  
  firstname: "homer",  
  lastname: "Simpson",  
  email: "homer@simpson.com",  
  password: "secret",  
  activities: ▶ {}  
}
```

POST /users/:id/activities : create activity for specific user (by id)

```
app.post("/users/:id/activities", ctx -> {
    service.createActivity(ctx);
});
```

```
public void createActivity(Context ctx) {
    String id = ctx.param("id");
    User user = pacemaker.getUser(id);
    if (user != null) {
        Activity activity = ctx.bodyAsClass(Activity.class);
        Activity newActivity = pacemaker
            .createActivity(id, activity.type, activity.location, activity.distance);
        ctx.json(newActivity);
    } else {
        ctx.status(404);
    }
}
```

POST /users/:id/activities : create activity for specific user (by id)

```
app.post("/users/:id/activities", ctx -> {  
    service.createActivity(ctx);  
});
```

Retrieve user id from url

```
public void createActivity(Context ctx) {  
    String id = ctx.param("id");  
    User user = pacemaker.getUser(id);  
    if (user != null) {  
        Activity activity = ctx.bodyAsClass(Activity.class);  
        Activity newActivity = pacemaker  
            .createActivity(id, activity.type, activity.location, activity.distance);  
        ctx.json(newActivity);  
    } else {  
        ctx.status(404);  
    }  
}
```

Lookup user in pacemaker

Recover activity payload from request

Return 'not found' if no matching user (by id)

Create new activity & return it to client
